

Patterns of retention in care during clients' first 12 months after HIV treatment initiation in Zambia

BACKGROUND

- Retention in HIV care during the first year after antiretroviral therapy (ART) initiation is one of the most important challenges facing many national HIV programs, with high reported rates of interruption to treatment (ITT) and disengagement from care.
- Despite the importance of the early treatment period, the timing and patterns of early ITT and disengagement from care remain poorly understood.
- In this brief we analyze routinely collected medical record data to reveal patterns of care in Zambia between ART initiation, 6 months, and 12 months after initiation.

METHODS

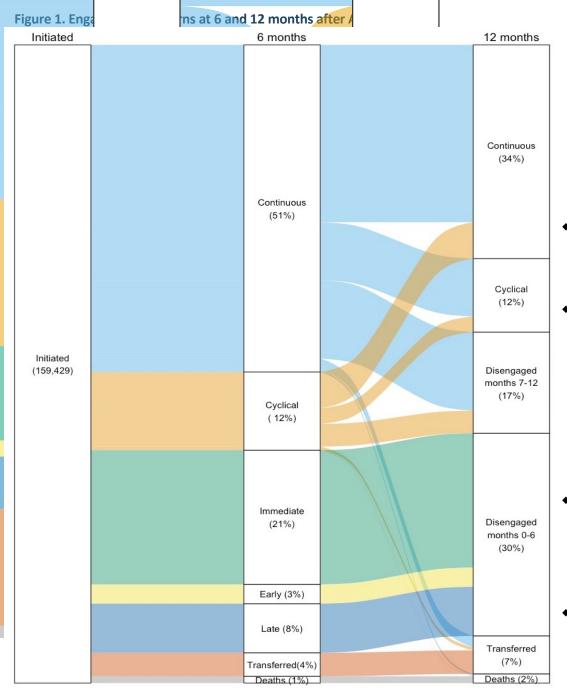

- Accessed SmartCare data provided to the IeDEA consortium by the Centre for Infectious Disease Research in Zambia (CIDRZ) for 543 healthcare facilities from early 2018 to early 2023.
- Included all adult clients who initiated ART on or after Jan 1, 2018 and had at least 14 months' follow up before censoring on Feb 28, 2023.
- Analyzed patterns of visit attendance and outcomes during the periods from 0-6 months and 7-12 months after dates of ART initiation.
- Defined visits as 1) "as planned" for visits that occurred on or before the next scheduled date; 2) "late ≤28 days" for visits that were attended after but ≤ 28 days of the scheduled date; 3) "late >28 days" for visits that were attended >28 days after the scheduled date; or 4) "scheduled not attended" to specify the date of disengagement for disengagers, 28 days after the last attended visit.

Pattern of	0-6 months after ART initiation	7-12 months after ART initiation
engagement		
Continuous	No visit > 28 days late in first 6 months and next visit	Continuous or cyclical at 6 months AND no visit > 28
	scheduled >6 months after initiation (i.e. all visits as planned	days late in months 7-12 and next visit scheduled >12
	or late ≤28 days)	months after initiation (i.e., all visits attended as
		planned or late ≤28 days)
Cyclical	Attended at least 1 visit late by more than 28 days between	Continuous or cyclical at 6 months; attended at least
	initiation and month 6 but subsequently re-engaged in care	one visit late by more than 28 days between months 7
	by 6 months after initiation.	and 12 but subsequently re-engaged in care by 12
		months after initiation.
Immediate	No visits after date of ART initiation; not observed during	Not reported for months 7-12; aggregated under
disengagement	months 0-6 after ART initiation	"Disengaged months 0-6"
Early	\geq 1 visit after date of ART initiation but last visit \leq 3 months	Not reported for months 7-12; aggregated under
disengagement	after initiation	"Disengaged months 0-6"
Late	≥1 visit after date of ART initiation but last visit 4-6 months	Not reported for months 7-12; aggregated under
disengagement	after initiation (and no scheduled visit in 7–12-month period)	"Disengaged months 0-6"
Disengaged	Composite pattern including all immediate, early, or late	Classified as immediate, early, or late disengagers in
months 0-6	disengagers in first 6 months; no visits observed after 6	first 6 months; no visits observed during months 7-12
	months	
Disengaged	Not reported for months 0-6	Classified as continuous or cyclical at 6 months; at least
months 7-12		1 visit observed in months 7-12 but ≥1 scheduled visit
		late by >28 days with no evidence of return during
		months 7-12
Transferred	Documented transfer to another healthcare facility during	Documented transfer to another healthcare facility at
	month 0-6	any time from 0-12 months
Died	Death recorded at any time from 0-6 months	Death recorded at any time from 0-12 months

Table 1. Defined retention patterns for each observed 6-month period

FINDINGS

- Figure 1 illustrates patterns of engagement in months 0-6 and months 7-12 after ART initiation.
- 51% of clients who initiated ART remained continuously engaged at 6 months (no visits > 28 days late), and 34% remained continuously in care at 12 months.
- 32% of initiators disengaged from care by 6 months; by 12 months, 47% had disengaged.

- A substantial minority of clients (12%) demonstrated cyclical engagement—they were often late but returned after interruptions.
- There were relatively few documented transfers to other facilities (4% in the first 6 months and 7% by the end of 12 months); many of those who appear to have disengaged are likely instead to have transferred informally and re-initiated care elsewhere (though potentially after an interruption).
- More than 20% of initiators did not return after the initiation visit (immediate disengagers); half of all disengagement in the first year occurred within the first 3 months.
- Because 44% of all those who disengaged in the first year never returned after their initiation visit, waiting for the second visit to intervene is too late.

CONCLUSIONS

- Rates of ITT and disengagement from care appear high during clients' first year after treatment initiation, but patterns of engagement are varied and dynamic, with many clients shifting between continuous and cyclical engagement.
- During the first 6 months, about half of those initiating do not need additional support to achieve continuous engagement, while outcomes for the other half may improve with targeted interventions.
- ◆ Tracking clients as they transfer among facilities is essential to understanding patterns of engagement.
