

## A COVID-19 vaccine delivery method guide:

# NASAL SPRAY

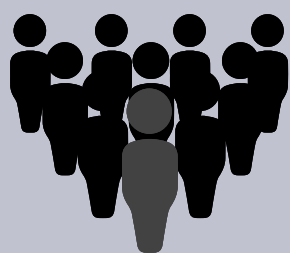

Nasal spray can be used to deliver vaccines and other medicines into the nasal cavities.

So far, only live virus vaccines have been delivered via nasal spray. The live virus is weakened and cannot survive at body temperature

- Live virus vaccines, like nasal sprays, are not recommended for:
- children under 2
  - pregnant women
  - immunosuppressed
  - immunocompromised

Nasal spray has been used for influenza vaccine delivery since 2003

Nasal spray vaccines may mean more people get vaccinated:

- minimally invasive
- self-application
- for those who fear needles
