Almost Exhaustive Testing for Combinational Devices

P.Frankl (France), M. Karpovsky, L. Levitin (USA)

Consider a combinational device with n inputs where each output implements a Boolean function of at most s input variables (s(n)). The problem of exhaustive testing of almost all such devices can be formulated as follows: construct a matrix $T(\varepsilon, n, s)$ (rows of $T(\varepsilon, n, s)$) are test patterns) with n columns such that all 2^S possible binary vectors appear in each s columns of the matrix, except a small fraction ε of all possible stuples. A test with $T(\varepsilon, n, s)$ as a test matrix is called (ε, s) -exhaustive.

The concept of (ξ, s) - exhaustive tests is a generalization of that of s-exhaustive tests (for $\xi = 0$), that have been recently considered in a number of papers [1,2,3,4]. A sequence of tests $T(\xi, n, s)$ is called asymptotically s-exhaustive, if $\xi \to 0$ with $n \to \infty$.

Considerations based on coding theory can be used to approach the problem of constructing efficient (\mathcal{E},s) -exhaustive tests. For instance, it is obvious that columns of an sexhaustive test is a subset of a code with the minimum distance $2^{\frac{r}{r-1}}$ between codewords and the maximum distance $|T(0,n,s)| - 2^{\frac{r}{r-1}}$, where |T(0,n,s)| is the number of rows in T(0,n,s).

Let $f(\xi,n,s)$ be the minimum number of test patterns in an (ξ,s) - exhaustive test and $\mathcal{Y}(n,s)$ = f(0,n,s).

In this paper upper and lower bounds for $f(\xi, n, s)$ are presented, and constructions of suboptimal (ξ, s) -exhaustive tests are suggested. Bounds for the number of test patterns in asymptotically s-exhaustive sequences of tests are also derived.

The main results obtained are summarized below.

Theorem 1 For n >> s and
$$\varepsilon > 0$$

$$f(\varepsilon, n, s) \leq \Im(r, s) ,$$
where
$$r = \begin{bmatrix} s(s-1)n \\ s(s-1)-2n & \ln(1-\varepsilon) \end{bmatrix} .$$
(1)

It follows from Theorem 1 that for any fixed E and s,

$$\lim_{n\to\infty} f(\varepsilon,n,s) \leq \Psi\left(\frac{x_{s(s-1)}}{2\ln(1-\varepsilon)}, s\right) < \infty$$

Theorem 2 (Lower bound)
$$f(\mathcal{E}, n, s) \geq 2^{S-2} \log_2 \frac{n-s+2}{(n-s+1)\mathcal{E} + 1}$$

$$f(\mathcal{E}, n, s) \geq 2^{S-2} \log_2 \mathcal{E} . \tag{2}$$

Theorem 3 (Constructive upper bound)

$$\begin{cases}
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]} \\
(\xi, \eta, \xi) \leq \frac{(2^{\xi} - 1) \log_2 \xi}{\log_2 [1 - (\xi!) (2^{\xi} - 1)]}$$

for $\log_2 n \le s \le cn$ (0 $\langle c \langle 1 \rangle$).

For $n \rightarrow \infty$ we obtain from (3)

$$f(\mathcal{E}, n, s) \lesssim c 2^{S} \log_2 \mathcal{E}^{-\frac{1}{4}}$$
, (4)

where $c = -(\log_2 0.711211...) = 2.034...$

A non-constructive upper bound, based on probabilistic reasoning, is given by Theorem 4.

Theorem 4

$$\frac{f(\varepsilon, n, s) \leq \frac{\log_2(\varepsilon + {n \choose s}^{-1}) - s}{\log_2(1 - 2^{-s})}$$
 (5)

Denote by $\Psi(n,s)$ the number of test patterns in tests which belong to an asymptotically s-exhaustive sequence of tests.

Theorem 5

1) For any asymptotically s-exhaustive sequence of tests, there exists a function Δ (n-s), such that Δ (n-s)-> ∞ when n-s -> ∞ and

$$\Psi(n,s) \gtrsim 2^{S} (n-s)$$
. (6)

2) For any $\Delta(n)$, such that $\Delta(n) \to \infty$ when $n \to \infty$, there exists an asymptotically s-exhaustive sequence of tests such that

$$\Psi (n,s) \langle 2^S \Delta (n) \rangle$$
 (7)

Theorem 5 shows that $\Psi(n,s)$ can grow substantially slower with n than $\Psi(n,s)$.
